

## Dolphin Day

I dream of their wet and slippery, smooth and oft skin. I hear their squeaky voices surrounding me. I feel warm-blooded heartbeats pounding through their bellies. I dream of dolphins in the deep blue sea.

Did you know dolphins can do many things? Believe it or not, dolphins can stay under water for 16 hours. We can't even stay under water for one hour. They have 16-18 pairs of teeth so they eat a lot of food, like fish. Some dolphins use squeaky noises to communicate. Dolphins are as loveable and intelligent as people.

## Digestive System

MMMMMM...

My saliva is the D.J. to the dancing journey. When my teeth bite into a snickers candy bar, my taste buds are being electrocuted by the goodness of it.

First, they do the electro-slide down the esophagus. It's a tube that is 25cm long.

Next, they do the worm in the stomach, which has smooth muscles.

It mashes and pushes it.

Then, they spin like a ballerina down into the small intestines which have twisted tubes that are 7 meters long.

Finally, they head bang down the intestines and leave the body.

## Digestive System

MMM... When burrito touches my mouth, my taste buds just go spinning. It makes my mouth water over and over again. The saliva starts mixing and mixing to get my burrito on its way through the digestive system.

Did you know that the esophagus is the next way it goes? The esophagus is 25 cm long. Then it goes to my stomach. It mixes with juices. Then it slides right into the small intestines. Did you know that the small intestine is seven meters long? Finally it makes its way out through the waste.
